

## CScan for Carrier Replacing Examinet

### Examinet Tool - End of Life (EOL) and End of Service/Support (EOSL)

Broadcloud for Carrier will be replacing the Examinet tool with the new CScan web-based tool. Providing an improved user experience, CScan is a network readiness tool designed to pre-qualify a customer's network for Calling services. A series of tests are run on port & bandwidth requirements to ensure a customer's network is ready to deploy the services.

#### **Effective October 31, 2021 Examinet will be End of Life (EOL) and End Of Service/Support (EOSL)**

##### **Benefits**

- Service Providers (SPs) continue to enjoy features of the tools they are accustomed to using with Examinet via the Service Provider portal.
- Service Providers initiate requests and view results via portals just as before the transition from Examinet.
- No additional software installation is required for end users.
- Easier for system administrators to run.

##### **Specifications and Support**

CScan is currently available [here](#). Once changes are deployed to the SP portal, integrating CScan and replacing Examinet, the change will be permanent and immediate, with no overlap time.

To prepare for the change, Service Providers (SP) and partners who maintain their own user guides will need to update their content.

The CScan Tool for SP guide is intended for BroadCloud PBX Service Providers and contains information about how to use the portal to access the CScan tool used for BroadCloud PBX end users service prequalification. For the CScan Tool for SP guide, click [here](#)

**Note:** For details on running the CScan tool, click [here](#).

If you have questions or require additional support on the transition from Examinet to CScan, please reach out to your account team or support group.
